

## **TDA8592J**

## $I^2\text{C-bus}$ controlled $4\times 50$ W power amplifier

Rev. 02 — 3 June 2005

**Product data sheet** 

The TDA8592J is a complementary quad BTL audio power amplifier made in BCDMOS technology. It contains four independent amplifiers in Bridge Tied Load (BTL) configuration. Through the I<sup>2</sup>C-bus, the diagnostic information of each amplifier and speaker can be read separately.

Both front and both rear channel amplifiers can be configured independently in line driver mode with a gain of 20 dB.

#### 2. Features

- I<sup>2</sup>C-bus control
- Hardware programmable I<sup>2</sup>C-bus address
- **Can** drive a 2  $\Omega$  load with a battery voltage of up to 16 V and a 4  $\Omega$  load with a battery voltage of up to 18 V
- DC-load detection: open, short and present
- AC-load (tweeter) detection
- Programmable clip detection: 1 % or 3 %
- Programmable thermal protection pre-warning
- Independent short-circuit protection per channel
- Low gain line driver mode (20 dB)
- Loss-of-ground and open V<sub>P</sub> safe
- All outputs protected from short-circuit to ground, to V<sub>P</sub>, or across the load
- All pins protected from short-circuit to ground
- Soft thermal clipping to prevent audio holes
- Low battery detection.

#### 3. Quick reference data

Table 1: Quick reference data

 $V_P = V_{P1} = V_{P2} = 14.4 V$ ; unless otherwise specified.

Symbol	Parameter	Conditions	Min	Тур	Max	Unit
$V_P$	operating supply voltage	$R_L = 4 \Omega$	8	14.4	18	V
Iq	quiescent current		-	280	400	mA

#### $I^2C$ -bus controlled $4 \times 50$ W power amplifier

Table 1: Quick reference data ...continued

 $V_P = V_{P1} = V_{P2} = 14.4 V$ ; unless otherwise specified.

Symbol	Parameter	Conditions	Min	Тур	Max	Unit
P <sub>o(max)</sub>	maximum output power	$\begin{split} R_L &= 4 \ \Omega; \\ V_P &= 14.4 \ V; \\ V_{IN} &= 2 \ V \ (RMS) \\ square \ wave \end{split}$	44	46	-	W
		$R_L = 4 \Omega;$ $V_P = 15.2 V;$ $V_{IN} = 2 V (RMS)$ square wave	49	52	-	W
		$R_L = 2 \Omega;$ $V_P = 14.4 V;$ $V_{IN} = 2 V (RMS)$ square wave	83	87	-	W
THD	total harmonic distortion		-	0.01	0.1	%
$V_{n(o)(amp)}$	noise output voltage in amplifier mode		-	50	70	μV
$V_{n(o)(LN)}$	noise output voltage in line driver mode		-	25	35	μV

## 6. Pinning information

#### 6.1 Pinning

## 6.2 Pin description

Table 3: Pin description

Symbol	Pin	Description
ADSEL	1	I <sup>2</sup> C-bus address selection
SDA	2	I <sup>2</sup> C-bus data input and output
PGND2	3	power ground 2
OUTRR-	4	channel right rear negative output
SCL	5	I <sup>2</sup> C-bus clock input
OUTRR+	6	channel right rear positive output
V <sub>P2</sub>	7	power supply voltage 2
OUTRF-	8	channel right front negative output
PGND1	9	power ground 1

 $I^2$ C-bus controlled  $4 \times 50$  W power amplifier

 Table 3:
 Pin description ...continued

Symbol	Pin	Description
OUTRF+	10	channel right front positive output
SVR	11	half supply voltage filter capacitor
INRF	12	channel right front input
INRR	13	channel right rear input
SGND	14	signal ground
INLR	15	channel left rear input
INLF	16	channel left front input
ACGND	17	AC ground
OUTLF+	18	channel left front positive output
PGND3	19	power ground 3
OUTLF-	20	channel left front negative output
V <sub>P1</sub>	21	power supply voltage 1
OUTLR+	22	channel left rear positive output
STB	23	standby or operating or mute mode select input
OUTLR-	24	channel left rear negative output
PGND4	25	power ground 4
DIAG	26	diagnostic and clip detection output; active LOW
TAB	27	heatsink connection, must be connected to ground

To keep the output pins on the front side, shift bending is applied.

## 7. Functional description

The TDA8592J is an audio power amplifier with four independent amplifiers configured in Bridge Tied Load (BTL) with diagnostic capability. The amplifier diagnostic functions give information about output offset, load, or short-circuit. Diagnostic functions are controlled via the I²C-bus. The TDA8592J is protected against short-circuit, over-temperature, open ground and open  $V_{\text{P}}$  connections. If a short-circuit occurs at the input or output of a single amplifier, that channel shuts down, and the other channels continue to operate normally. The channel that has a short-circuit can be disabled by the microcontroller via the appropriate enable bit of the I²C-bus to prevent any noise generated by the fault condition from being heard.

#### 7.1 Start-up

When pin STB is LOW, the total quiescent current is low and the I<sup>2</sup>C-bus lines are high-impedance.

When pin STB is HIGH, the I<sup>2</sup>C-bus is biased and then the TDA8592J performs a power-on reset. When bit D0 of instruction byte IB1 is set, the amplifier is activated, bit D7 of data byte 2 (power-on reset occurred) is reset, and pin DIAG is no longer held LOW.

 $I^2$ C-bus controlled  $4 \times 50$  W power amplifier

#### 7.2 Start-up and shut-down timing

A capacitor connected to pin SVR enables smooth start-up and shut-down, preventing the amplifier from producing audible clicks at switch-on or switch-off. The start-up and shut-down times can be extended by increasing the capacitor value.

If the amplifier is shut-down using pin STB, the amplifier is muted, and the capacitor connected to pin SVR discharges. The low current standby mode is activated 2 seconds after pin STB goes LOW; see Figure 8.

#### 7.3 Power-on reset and supply voltage spikes

If the supply voltage drops too low to guarantee the integrity of the data in the  $I^2C$ -bus latches, the power-on reset cycle will start. All latches will be set to a pre-defined state, pin  $\overline{DIAG}$  will be pulled LOW to indicate that a power-on reset has occurred, and bit D7 of data byte 2 is also set for the same reason. When D0 of instruction byte 1 is set, the power-on flag resets, pin  $\overline{DIAG}$  is released and the amplifier will then enter its start-up cycle; see Figure 9 and see Figure 10.

#### 7.4 Diagnostic output

Pin DIAG indicates clipping, thermal protection pre-warning, short-circuit protection, low and high battery voltage. Pin DIAG is an open-drain output, is active LOW, and must be connected to an external voltage via an external pull-up resistor. If a failure occurs, pin DIAG remains LOW during the failure and no clipping information is available. The microcontroller can read the failure information via the I<sup>2</sup>C-bus.

#### 7.5 Muting

A hard mute and a soft mute can both be performed via the I<sup>2</sup>C-bus. A hard mute mutes the amplifier within 0.5 ms. A soft mute mutes the amplifier within 20 ms and is less audible. A hard mute is also activated if a voltage of 8 V is applied to pin STB.

#### 7.6 Temperature protection

If the average junction temperature rises to a temperature value that has been set via the  $I^2C$ -bus, a thermal protection pre-warning is activated making pin  $\overline{DIAG}$  LOW. If the temperature continues to rise, all four channels will be muted to reduce the output power (soft thermal clipping). The value at which the temperature mute control activates is fixed: only the temperature at which the thermal protection pre-warning signal occurs can be specified by bit D4 in instruction byte 3. If the temperature mute control does not reduce the average junction temperature, all the power stages will be switched off (muted) at the absolute maximum temperature  $T_{j(max)}$ .

#### 7.7 Offset detection

Offset detection can only be performed when there is no input signal to the amplifiers, for instance when the external digital signal processor is muted after a start-up. The output voltage of each channel is measured and compared with a reference voltage. If the output voltage of a channel is greater than the reference voltage, bit D2 of the associated data byte is set and read by the microcontroller during a read instruction. Note that the value of this bit is only meaningful when there is no input signal and the amplifier is not muted. Offset detection is always enabled.

 $I^2$ C-bus controlled  $4 \times 50$  W power amplifier

#### 7.8 Speaker protection

If one side of a speaker is connected to ground, a missing current protection is implemented to prevent damage to the speaker. A fault condition is detected in a channel when there is a mismatch between the power current in the high side and the power current in the low side; during a fault condition the channel will be switched off.

The load status of each channel can be read via the  $I^2C$ -bus: short to ground (one side of the speaker connected to ground), short to  $V_P$  (one side of the speaker connected to  $V_P$ ), and shorted load.

#### 7.9 Line driver mode

An amplifier can be used as a line driver by switching it to low gain mode. In normal mode, the gain between single-ended input and differential output (across the load) is 26 dB. In low gain mode the gain between single-ended input and differential output is 20 dB.

#### 7.10 Input and AC ground capacitor values

The negative inputs to all four amplifier channels are combined at pin ACGND. To obtain the best performance for supply voltage ripple rejection and unwanted audible noise, the value of the capacitor connected to pin ACGND must be as close as possible to 4 times the value of the input capacitor connected to the positive input of each channel.

#### 7.11 DC-load detection

When DC-load detection is enabled, during the start-up cycle, a DC offset is applied slowly to the amplifier outputs, and the output currents are measured. If the output current of an amplifier rises above a certain level, it is assumed that there is a load of less than 6  $\Omega$  and bit D5 is reset in the associated data byte register to indicate that a load is detected.

Because the offset is measured during the amplifier start-up cycle, detection is inaudible and can be performed every time the amplifier is switched on.

#### 7.12 I<sup>2</sup>C-bus address selection

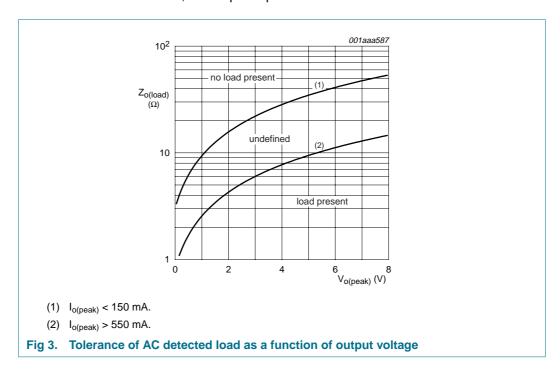

If in the application more amplifiers are used, the I<sup>2</sup>C-bus address of the TDA8592J can be changed with an external resistor: see Section 8.

#### 7.13 AC-load detection

AC-load detection can be used to detect that AC-coupled speakers are connected correctly during assembly. This requires at least 3 periods of a 19 kHz sine wave to be applied to the amplifier inputs. The amplifier produces a peak output voltage which also generates a peak output current through the AC-coupled speaker. The 19 kHz sine wave is also audible during the test. If the amplifier detects three current peaks that are greater than 550 mA, the AC-load detection bit D1 of instruction byte IB1 is set to logic 1. Three current peaks are counted to avoid false AC-load detection which can occur if the input signal is switched on and off. The peak current counter can be reset by setting bit D1 of instruction byte IB1 to logic 0. To guarantee AC-load detection, an amplifier current of more than 550 mA is required. AC-load detection will never occur with a current of less

 $I^2$ C-bus controlled  $4 \times 50$  W power amplifier

than 150 mA. Figure 3 shows which AC-loads are detected at different output voltages. For example, if a load is detected at an output voltage of 2 V (peak), the load is less than 3.5  $\Omega$ . If no load is detected, the output impedance is more than 13  $\Omega$ .

#### 7.14 Load detection procedure

#### Procedure:

- 1. At start-up, enable the AC or DC-load detection by setting D1 of instruction byte IB1 to logic 1.
- 2. After 250 ms the DC-load is detected and the mute is released. This is inaudible and can be implemented each time the IC is powered on.
- When the amplifier start-up cycle is completed (after 1.5 s), apply an AC signal to the input, and DC-load bits D5 of each data byte should be read and stored by the microcontroller.
- 4. After at least 3 periods of the input signal, the load status can be checked by reading AC-detect bits D4 of each data byte.

The AC-load peak current counter can be reset by setting bit D1 of instruction byte IB1 to logic 0 and then to logic 1. Note that this will also reset the DC-load detection bits D5 in each data byte.

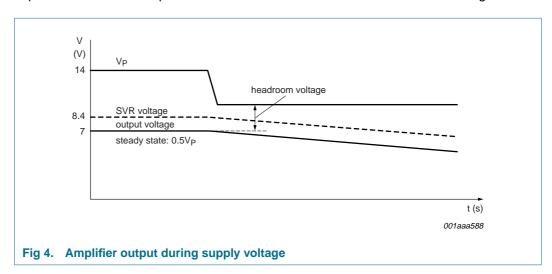

#### 7.15 Low headroom protection

The normal DC output voltage of the amplifier is set to half the supply voltage and is related to the voltage on pin SVR. An external capacitor is connected to pin SVR to suppress power supply ripple. If the supply voltage drops (at vehicle engine start), the DC output voltage will follow slowly due to the affect of the SVR capacitor.

#### $I^2$ C-bus controlled $4 \times 50$ W power amplifier

The headroom voltage is the voltage required for correct operation of the amplifier and is defined as the voltage difference between the level of the DC output voltage before the  $V_P$  voltage drop and the level of  $V_P$  after the voltage drop; see Figure 4.

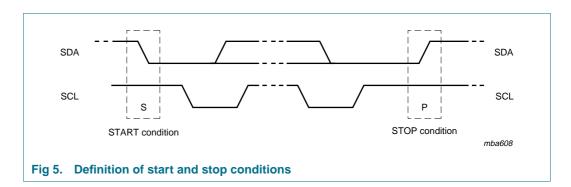

At a certain supply voltage drop, the headroom voltage will be insufficient for correct operation of the amplifier. To prevent unwanted audible noises at the output, the headroom protection mode will be activated; see <a href="Figure 9">Figure 9</a>. This protection discharges the capacitors connected to pins SVR and ACGND to increase the headroom voltage.

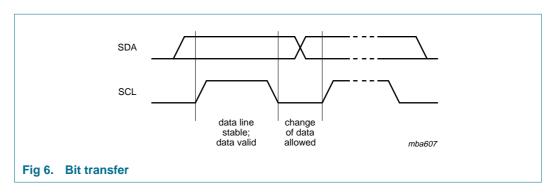

## 8. I<sup>2</sup>C-bus specification

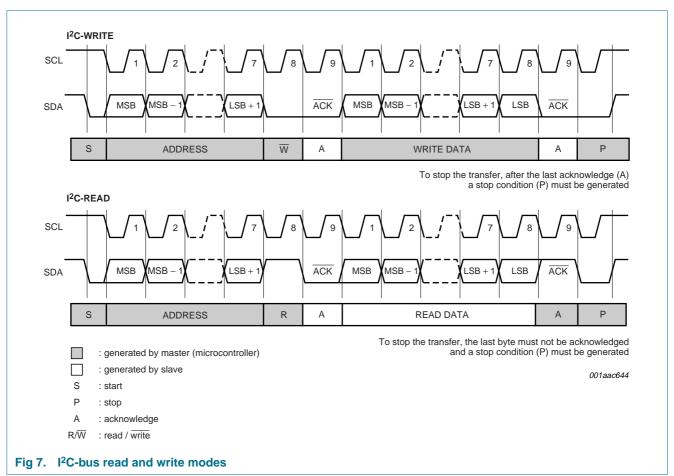

Table 4: Device address with hardware address selection; see Figure 23

R <sub>ADSEL</sub>	A6	A5	A4	А3	A2	A1	A0	R/W
300 k $\Omega$	1	1	0	1	1	0	0	0 = write to device
								1 = read from device

								1 = read from device
1 kΩ	1	1	0	1	1	1	1	0 = write to device
								1 = read from device

TDA8592J

#### 8.1 Instruction bytes

**Philips Semiconductors** 

If bit  $R/\overline{W} = 0$ , the TDA8592J expects 3 instruction bytes: IB1, IB2 and IB3.

After a power-on reset, all instruction bits are set to zero.

#### $I^2C$ -bus controlled $4 \times 50$ W power amplifier

Table 5: Instruction byte IB1

Bit	Description
D7 to D2	-
D1	AC or DC-load detection switch
	0 = AC or DC-load detection off; resets DC-load detection bits and AC-load detection peak current counter
	1 = AC or DC-load detection on
D0	amplifier start enable (clear power-on reset flag, D7 of DB2)
	0 = amplifier off; pin DIAG remains LOW
	1 = amplifier on; when power-on occurs, bit D7 of DB2 is reset and pin $\overline{\text{DIAG}}$ is released

#### Table 6: Instruction byte IB2

Bit	Description
D7 to D2	-
D1	soft mute all amplifier channels (mute delay 20 ms)
	0 = no mute
	1 = mute
D0	hard mute all amplifier channels (mute delay 0.4 ms)
	0 = no mute
	1 = mute

#### $I^2C$ -bus controlled $4 \times 50$ W power amplifier

## 12. Application information

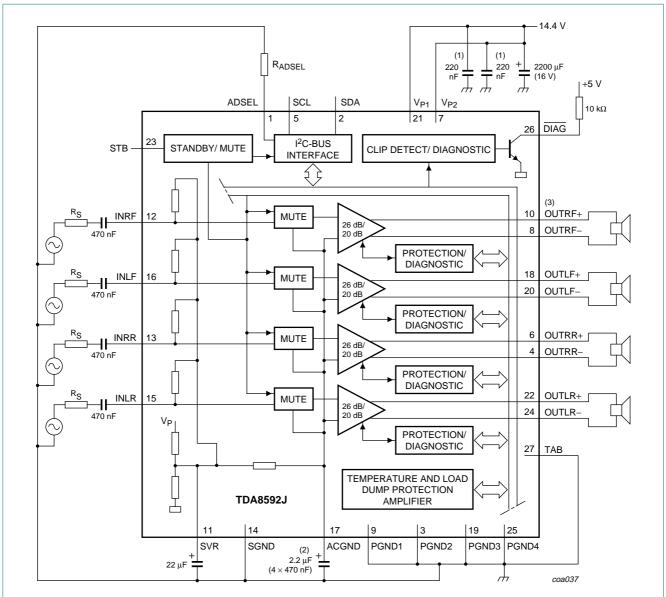

The beep input circuit is to amplify the beep signal from the microcontroller to all 4 amplifiers (gain = 0 dB).

Remark: This circuit will not effect the amplifier performance

#### $I^2$ C-bus controlled $4 \times 50$ W power amplifier

## 12.1 Test and application information

#### (1) Supply decoupling:

The high frequency decoupling capacitors (220 nF) should be connected as close as possible to the supply pins. It is important that these capacitors are of good quality. When several channels are shorted to the supply simultaneously, high peak voltages can occur at the supply line due to the activation of the protections. The high frequency decoupling capacitors should suppress these voltage peaks.

Good results have been achieved with 0805 case size capacitors (X7R material, 220 nF) connected close to each of the supply pins.

- $\begin{tabular}{ll} \end{tabular} \begin{tabular}{ll} \end{tabular} \beg$
- (3) A capacitor of 10 nF may be added from every amplifier output to ground for EMC reasons.

## 15. Data sheet status

Level	Data sheet status [1]	Product status [2] [3]	Definition
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

- [1] Please consult the most recently issued data sheet before initiating or completing a design.
- [2] The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL http://www.semiconductors.philips.com.
- [3] For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

#### 16. Definitions

**Short-form specification** — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Application information** — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

#### 17. Disclaimers

**Life support** — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors

customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

 $I^2$ C-bus controlled  $4 \times 50$  W power amplifier

Right to make changes — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
